

## Electric Bike

### handlebar assembly

1. Unloosen the Allen screws of the handlebar clamp and remove the screws and clamp from the steering head.

2. Place the handlebar in the protrusion of the steering head.

3. Assemble the clamp with both screws and tighten them so that you can still turn the handlebar in the steering head. By turning the handlebar, you can set it to a position that is comfortable for you. Finally tighten up both screws (6-7 Nm). Adjust the display, shifting system, brake and bell according to the handlebar's position.

4. Make sure that the display's cable joint attached to the headtube is screwed down tightly for it to be properly water-tight.
